# Minecraft Dungeons 2: thoughts and future possibilities

Upon joining Minecraft Dungeons 2, I was immediately stunned by the beauty of the game. The first thing I saw was my character walking onto the screen and sitting by the fire. It was reminiscent of MD1, but I could tell that the graphical style of the game was much more charming and thoughtful in its execution.

The game began with escaping Squid Coast, which got me excited about the lore (I always seem to love a good escape in stories). Unfortunately, I immediately started feeling disappointed. Yes, we were learning the controls, but it would have made more sense if the mobs themselves were forcing us out of Squid Coast for example, instead of just being told to leave and killing two mobs on the way. Of course, I didn't expect the team to make every single mechanic and visual match the story, but this would prove to be a trend of underdevelopment.

The cutscene after was probably my favorite one: traveling across the ocean in the boats. It painted a vibrant picture of the villagers and players piled into boats, which had a chaotic vibe. But as you got to the other side, there was a really nice contrast with the escape where everything was a bit more organized, sunny, and cheery. I also saw seagulls and a baby pig, both of which I thought were extremely cute and made me hope they would show up later (they didn't).

After arriving in Brave Haven, it instantly became my favorite place in the game. It reminded me of my own project I started but never really finished: a coastal city in my server called Sanctum. Sanctum would have been a small, quiet town by the ocean founded by people escaping the chaos of the capital city of our world, had it ever been constructed. Brave Haven had a similar goal in mind, being a peaceful hub in an otherwise chaotic world. The visuals and animations worked together to achieve that purpose, and it honestly made me want to build something like that in the base game again.

Unfortunately, the level of care spent on visuals didn't seem to flow into the game itself. While the world was beautiful, the actual gameplay systems often feel short of expectations. Mainly, this became clear as I played through its item systems, repetitive gameplay, and lack of immersion.

The item systems were the first major issue I encountered with the game. First off, items seemed completely random, dropping anywhere instead of making sense for the situation/location (with the exception of quest rewards). Items had underdeveloped descriptions, as well as having few unique abilities like in the first game, which was disappointing. Most items just applied some boost or effect. The stats screen was also much worse than the base game. Instead of bars showing you the breakdown and comparison of stats like damage, there were about two sentences of subjective information instead. It is worth noting that the blacksmith was improved to let you keep items up to date and that the items could be managed in a smaller quick inventory, but these hardly make up for the issues in the item system.

The gameplay was also very repetitive. For example, in the Honeycomb fields, there were two steps in a hive building quest (collecting wood and finding hive location) that felt like the exact same activity even though they should have been different steps. They both involved walking to a marked location, killing the mobs, and interacting with the point. This was true of many other quests as well, that the task you did besides killing mobs was very generic.

Contrast this with a particular part of the ocean monument in Minecraft Dungeons I, where you had to solve a puzzle to unlock a set of doors. There was a conduit with air around it you could pick up,

and as you walked it revealed lines on the floor leading to the doors. The conduit could then be put into the door to open it. That was a feature I found really interesting.

The ocean monument was more memorable and exciting for me because you could interact with the environment in a meaningful way. Instead of just picking up a key and killing more mobs, I had to understand how the conduit mechanic worked and use it effectively. It made the place feel more alive rather than just another monster spawner.

Finally, as I touched on before, the story didn't usually match the mechanics. The best games connect their mechanics to what is happening in the world. In Satisfactory, you are placed on a planet with the mission of building a manufacturing base, and the mechanics allow you to extract resources and turn them into products. In Fortnite, the goal is to be the last player remaining, and the mechanics allow you to traverse the map and gain power through loot. Of course, MD2 does this as well, but its mechanics lack the depth to make the world feel convincing. I already brought up the Squid Coast example, but villages offer another one. Different places should provide different things, yet in MD2, the offerings rarely change based on the lore of the place: the same villagers and random loot appear in every place. As a result, places that should feel connected to their environment often felt generic. I think this contributed to my inability to become immersed in the game, as the mechanics often felt disconnected from the situations they should have complemented.

So, what did I learn from my experience in MD2? More importantly, what can we learn about our beloved Minecraft theory from it? I don't believe the expansion of the Minecraft franchise into MD2 and the Sift will meaningfully change the base game itself. Instead, MD2 serves as a cautionary tale for anyone looking to design an experience. Visuals can give a world character, but its mechanics determine how players interact with it. If those mechanics feel repetitive or disconnected from the world, even the most beautiful environments can lose their spark. Whether we're designing games, building worlds, or studying systems within them, we should take care to consider not only how an experience looks, but also how its underlying systems make it feel meaningful.
